

Linux VPS Setup – CSC cPouta (Option 3)

The goal of this assignment is to set up a Linux VPS in a cloud service and make it accessible through the internet.

1. First I created a project in CSC cPouta for the Cloud Services course. This project is used to manage my cloud resources and virtual machine.

I made an academic Cloud Services project in MyCSC and enabled cPouta for the project.

2. Then I created a VM in CSC cPouta using Ubuntu Linux. The VM is active and running, and I assigned a floating public IP address to my VM so that it can be accessed from the internet.

3. I connected to my Ubuntu VM using SSH with PuTTY. I used the ubuntu user, my public IP address, and my SSH private key to securely access the server.

```
ubuntu@cloudservicescourse:~$
```

- After that I installed Apache2 on my Ubuntu VM using the command `sudo apt install apache2`. I checked the Apache service and it was running successfully.

Active: **active (running)**

- I edited the `index.html` file in `/var/www/html` using `sudo nano /var/www/html/index.html` and added my own text to the webpage.

```
GNU nano 8.7.1 /var/www/html/index.html
}
</style>
</head>
<body>
  <div class="main_page">
    <div class="page_header floating_element">
      
    <div>
      <span style="margin-top: 1.5em;" class="floating_element">
        Apache2 Default Page
      </span>
    </div>
    <div class="banner">
      <div id="about"></div>
      It works yayyyyy!
    </div>
    <div class="content_section floating_element">
```

- Lastly I tested website by opening `http://86.50.231.82` in a web browser. My webpage was displayed successfully, showing that Apache was working and my website was accessible from the internet.

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

- Here is my public VPS URL: [Public VPS URL: http://86.50.231.82](http://86.50.231.82)
